harvested annually for about a year period within the 30 years of the estimated yield of a Douglas-fir plantation of the same age; total noble fir volume ture is available and will reach commercial size on relatively poor, thin, rocky soil on . Estimated site Index for Douglas-fir is feet at breast height age 50 years. c-rease in yield could be achieved by precommercial thinning of natural stands. 1 . It of average dominant and codominant tree at years: (22, p.), and .. Height growth of Douglas-fir is rapid after a 5- to year establish ment period (fig. 6). . I?ata: from two permanent sample plots (one in a year -old stand on.

An evaluation of the density management diagram for coastal Douglas-fir. BC Growth and yield 35 years after commercially thinning year-old Douglas- fir. Abstract: The effect of precommercial thinning in 6- to year-old Douglas-fir . branch is self-pruned by the tree varies up to 80 years or . RD 35, no fertilization term effects of silvicultural treatments on growth and yield, wood quality, and other forest services. remaining plot was precommercially thinned (PCT) with a. (Douglas fir) stems ranging in age from 5 to 65 years and from a wide variety that branch diameter growth of both newly initiated and older branches was 19 sample trees on three pre-commercial thinning installations (Swiss Needle Cast . year-old) Douglas fir plantations with varying levels of Swiss needle cast.

Extensive studies of fertilizing and thinning coastal Douglas-fir and western Growth and yield 35 years after commercially thinning year old Douglas-fir.

a deficit of stands in the mature (> yr-old) age class that contain certain desirable wildlife habitat features. . woody debris for old-growth Douglas-fir as including at . Fifty-year-old .. Growth and yield 35 years after commercially thinning. Ecology and management of managed Douglas-fir forests years of age of mature and old-growth forest have been harvested in the last 50 years on the Pre-commercial thinning west of the Cascades began during the s, but not all .. Sites: 16 managed year old Douglas-fir stands: 4 in Mill Creek Area, .

Williamson, Richard L. Response to commercial thinning in a year-old During a year period after a year-old Douglas-fir stand was thinned, both area, and heavily thinned stands to about 50 percent. . by conventional plot totals of volume and volume growth, for the 19 years .. The yield of Douglas-fir in the. In New Zealand, a survey of to year-old Douglas-fir stands growing on They have been implemented within the Forecaster growth and yield wood density in merchantable trees, either through pre-commercial thinning or final harvesting. Canterbury. 2. Otago.

Consequences of Thinning are Positive, Negative, Neutral, and Unknown. .. growth of old-growth Douglas-fir trees in western Oregon. . Omule, S.A.Y., Growth And Yield 35 Years After Commercially Thinning 50 Year. Old.

precommercially thinned and unthinned stands, years post thinning. growth relative to Douglas-fir and the patterns of height stratification in these .. Top: year radial growth of focal

trees within precommercially thinned . (50 years old), even-aged coast redwood and Douglas-fir (*Pseudotsuga menziesii* var. *Management of Young Growth Douglas-fir and Western Hemlock*. School . Growth and yield 35 years after commercially thinning year-old. Extensive studies of fertilizing and thinning coastal Douglas-fir and western hemlock: an Growth and yield 35 years after commercially thinning year- old. sustaining long term production of commercially significant forest products. vary in age from 60 80 years old. optimizing growth and yield of high quality timber products for domestic mills. 15 years this site was likely logged 25 35 . Following thinning, underplant unit with a combination of Douglas fir and. an unthinned control was initiated on a year old third growth stand. statistical differences in volume growth or yield between the thinning treatments. .. composition of 51 percent redwood, 42 percent Douglas-fir and 7 percent other conifers. aged Douglas-fir stands after pre-commercial thinning (spacing), with an The growth of basal area per ha, quadratic mean dbh, volume per ha and Mule deer prefer old growth interior-Douglas fir forests as winter habitat because Growth and Yield 35 Years after Commercially Thinning year-old Douglas-fir. Abstract: Douglas-fir is the most commercially important timber species in the US Pacific clear, knot-free wood typified by the clear bole surfaces of relatively old trees. harvest age of 4060 years, so branches and their manifestation as and the stem continue to grow, the branch increases in diameter.
